Adaptive Analysis for Australian Stocks, by Nick Radge

Adaptive Analysis for Australian Stocks is a great guide for technical traders, containing plenty of visual and statistical material to provide a comprehensive analysis of Australian stocks for 2005.

In *Adaptive Analysis for Australian Stocks*, Radge explains how to use price action to make the most of your winning trades and to quickly recognise a losing trade and exit your position.

Radge breaks down and provides new insight into common market theory, including Elliott wave theory, micro patterns, risk management and exit strategies. This theory is then applied to the price action of Australian stocks, always with the same focus – making more when you win and losing less when you lose.

Written specifically for the Australian market, Radge's interpretation of technical analysis methods is original and easy to apply, explained in simple terms, and a valuable guide for all traders of stocks, CFDs, options and warrants.

Adaptive Analysis for Australian Stocks is, despite its simplifications, probably suited more to the experienced trader. Newcomers may wish to do their research first, and use such technical analyses as they become more accustomed to stock market conditions.
